

πυλαίο διάστημα

This histological image shows a section of liver tissue stained with hematoxylin and eosin (H&E). The tissue is organized into three distinct zones radiating from a central vein at the bottom. Zone 1 (ZΩΝΗ 1) is the innermost zone, closest to the central vein, characterized by cords of hepatocytes. Zone 2 (ZΩΝΗ 2) is the middle zone. Zone 3 (ZΩΝΗ 3) is the outermost zone, farthest from the central vein, containing more sinusoids and some lipid accumulation. A portal space (πυλαίο διάστημα) is visible at the top, containing a portal triad. The central vein (κεντρική φλέβα) is located at the bottom center.
